

BMO F27 Business Plan Agent — Deployment and Redevelopment Guide

Prepared by Tactable · Oct 5, 2026

What is in the package

Four Copilot Studio solution files, forming two independent agents. Each agent ships in both unmanaged and managed form. Import the managed file into BMO's target environment; keep the unmanaged file as the editable source.

File	Agent	Type	Version	Components
BMOBusinessPlanCoachNonAIVersion_1_0_0_2_managed.zip	Non-AI	Managed	1.0.0.2	95
BMOBusinessPlanCoachNonAIVersion_1_0_0_1.zip	Non-AI	Unmanaged	1.0.0.1	95
BMOBusinessPlanCoachAIVersion_1_0_0_2_managed.zip	AI	Managed	1.0.0.2	43
BMOBusinessPlanCoachAIVersion_1_0_0_1.zip	AI	Unmanaged	1.0.0.1	43

Non-AI version (crd10_bmoBPCoachV2) is the build to deploy. Twelve-topic flow, full fr-CA and fr-FR localisation alongside English, and it writes captured answers to a SharePoint list on submit.

AI version (crd10_bmoAdvisorBusinessPlanCoach) is conversation-only — same twelve topics, no outbound write, no connector. Built before the decision not to proceed with AI, and included so the work is there if generative capability is enabled later. Testing evals have not been done for this.

Both enable the Teams and Microsoft 365 Copilot channels, and both publish automatically on import.

Before you import

Five things need to exist in the BMO environment first. The import will succeed without the last two, but the agent will fail at submit.

1. **A Power Platform environment with Dataverse provisioned.** Copilot Studio solutions cannot be imported into an environment without a Dataverse database.
2. **Microsoft Copilot Studio enabled, with licences assigned** to whoever will import and to whoever will test. This is the enablement referred to in the SOW assumptions.
3. **System Customizer or System Administrator** role for the person performing the import.
4. **A SharePoint list holding one row per advisor.** This list is both the source of advisor context and the destination for submitted plans. Each row must carry the advisor's sign-in email and their four F26 projection figures. The agent looks the advisor up by email at session start and patches that same row on submit, so an advisor without a row cannot begin a session at all.
5. **A SharePoint Online connection**, created in the target environment by an account with read and write access to that list. The connection reference in the solution binds to this at import time.

The AI version needs items 1 to 3 only — no connector, no outbound write — so it runs as soon as it is imported.

Importing the solution

Use the managed file for any environment BMO will run or demonstrate from, the unmanaged file only where topics will be edited.

1. Open the Power Platform admin centre and select the target environment.
2. Go to **Solutions**, then **Import solution**, and choose `BMOBusinessPlanCoachNonAIVersion_1_0_0_2_managed.zip`.
3. At the connections step, bind the SharePoint Online connection reference to the connection created in the prerequisites. The reference is named `crd10_bmoBPCoachV2.shared_sharepointonline.985e1b6b62694e8694c01b4206d6386c`. If no connection is offered, cancel out, create one under **Connections**, and restart the import.
4. Complete the import and wait for it to finish. The solution is configured to publish on import, so the agent will appear in Copilot Studio automatically.
5. Repeat for the AI version if BMO wants it available. It has no connections step.

Repointing the advisor lookup

The agent reads from SharePoint as well as writing to it, and the read runs **before the first question**. Not repointed, the agent ends the conversation on the opening turn and no advisor reaches the planning flow.

At session start, X99-Setup takes the signed-in user's email, filters the list on the **Microsoft Account Email** column, and pre-loads the advisor's context from the row it finds:

Variable	Source column	What it holds
Global.ItemId	ID	The row the save step will later patch
Global.Role	Role	IA, IC or PB
Global.LeadIACode	Lead IA Code	Lead IA code
Global.RevenueProj	Revenue_Proj	F26 projected revenue
Global.NetNewAssetsProj	Balance Growth_Proj	F26 projected Net New Assets
Global.InternalReferrals	Internal Referrals	F26 internal referral revenue
Global.ExternalReferrals	External Referrals	F26 external referral revenue

The advisor's name comes from their sign-in, not the list.

Global.ItemId is set here and used by the save step later, so the agent updates the advisor's existing row rather than creating a new one. Repointing the save step without repointing the lookup will not work.

If the lookup finds no row, the agent sends this and ends the conversation:

The email address {System.User.Email} is not associated with the corresponding SharePoint file. Please contact support.

So the list has to hold a row for every advisor before any of them opens the agent. Two things to settle during transition: reword that message to name a real BMO contact, and decide whether advisors without a row should be let through with projections unset. Both are small changes we can walk through.

What to change

1. Open the agent in Copilot Studio, go to **Topics**, then X99-Setup.
2. Select the **Invoke connector action** node and repoint the site and list, as in the save step below. They are the same site and the same list.
3. Confirm the filter column. The shipped filter uses the internal name `Microsoft_x0020_Account_x0020_Em`, which corresponds to a column displayed as **Microsoft Account Email**. BMO's equivalent column will have its own internal name.
4. Remap the seven value assignments above to BMO's column names.
5. Reword the not-found message to name a real BMO contact.
6. Save and republish.

Repointing the save step

Do not skip this. The agent will import, publish and hold a full conversation without it, then fail silently at the final step.

X07-Save writes the plan to SharePoint using the `PatchItem` operation. Three things in it are hardcoded to the Tactable environment:

Setting	Value as shipped	What BMO must change it to
dataset	<code>https://tactableio.sharepoint.com/sites/ConorTestSite</code>	The URL of the BMO SharePoint site holding the plan list
table	<code>5f342848-3c91-417f-b830-6ee0d1023ebd</code>	The GUID of the BMO list
id	<code>Global.ItemId</code>	No change needed — set during the conversation
item	Eleven <code>field_N</code> assignments	The internal column names of the BMO list

To change them:

1. Open the agent in Copilot Studio and go to **Topics**, then X07-Save.
2. Select the **Invoke connector action** node.
3. Replace the site URL and list with the BMO equivalents. Selecting them from the picker rather than typing them is safer, since it resolves the GUID for you.
4. Remap each of the eleven value assignments to the correct BMO column, using the field mapping table in the next section. The `field_N` names are SharePoint internal names from the Tactable list and will almost certainly differ in BMO's.
5. Save and republish the agent.

Why it fails quietly

The save node has no error branch. If the connection is unbound or the list cannot be resolved, the agent still closes the conversation and still tells the advisor the plan is submitted. Nothing is written. So a smoke test has to confirm the row in SharePoint, not the agent's closing message.

Adding an error branch so the advisor sees a failure is a small change, and one we can walk through during transition.

Field mapping

The eleven values the save step writes. Use the last column to record the BMO equivalent before remapping.

Internal name	Column as displayed	Agent variable	What it holds	BMO column
field_9	Rev. Target	Global.RevTarget	F27 revenue goal	
field_11	Balance Target	Global.NetNewAssetsTarget	F27 Net New Assets goal	
field_13	Ext Referral Target	Global.ExtReferralTarget	F27 external referral target	
field_15	Int Referral Target	Global.IntReferralTarget	F27 internal referral target	

Internal name	Column as displayed	Agent variable	What it holds	BMO column
field_18	Strategy - Dropdown 1	Topic.StrategyToSave	Selected strategy	
field_19	Referral LOB	Global.ReferralLOB	Primary referral Line of Business	
field_20	Where_are_you_now	Global.WhereAreYouNow	Current state	
field_21	What_are_your_options	Global.WhatAreYourOptions	Options considered	
field_22	What_do_you_want_to_Achieve	Global.WhatDoYouWantToAchieve	Objective	
field_23	Next Steps	Global.NextSteps	Next steps	
field_24	Firm Support - Comments	Global.FirmSupport	Support asks	

Topic.StrategyToSave is derived: it holds the listed strategy, or Other: plus the advisor's own wording when they pick Other, so their phrasing survives in one column.

Net New Assets sits in columns named for balances — Balance Target writing, Balance Growth_Proj reading. That follows the F27 main table rather than the language the agent uses, and it is an easy one to map wrongly.

Values held but not written

The conversation captures more than it saves. The revenue growth percentage, review cadence and selected option appear in the on-screen summary but have no column in the save step. If BMO's list has columns for them, they can be added to the same node alongside the existing eleven.

Confirming the import worked

Run this once in the target environment before showing the agent to anyone. About ten minutes.

1. Open the agent in Copilot Studio and use the test pane, signed in as an account that has a row in the list. Send start. If the lookup is working, the opening text appears and the agent asks its first question. A message about an email address not being associated with the SharePoint file means the lookup is not repointed, or that account has no row.
2. Answer through the quantitative topics — revenue, Net New Assets, internal and external referrals. Phrase one figure loosely, for example 1.4m, to confirm number parsing survived the import.
3. Confirm the agent states the F26 projection figures from the advisor row before asking for each F27 target. Wrong or blank projections mean the lookup is mapped to the wrong columns. Then confirm the revenue growth percentage is arithmetically correct against the projection and the goal.
4. Work through the qualitative topics to the summary.
5. At the summary, check every value you gave is played back accurately.
6. Submit, then **open the SharePoint list and confirm the row was written**. The agent's closing message is not evidence of this. If the row is absent or empty, return to the repointing section.
7. Switch language to French and confirm the topics render in fr-CA. The English and French topic sets are separate components, so a partial import shows up here.

If something is wrong

Symptom	Likely cause
Agent does not appear after import	Solution imported but not published; publish manually
Conversation ends on the opening turn, with a message about an email address	Lookup not repointed, or the signed-in account has no row in the list
Agent starts, but states blank or wrong F26 projections	Lookup mapped to the wrong columns
Conversation runs, nothing written at submit	Connection reference unbound, or save step not repointed

Symptom	Likely cause
Save step errors on the column names	Field names not remapped to BMO's internal column names
French topics fall back to English	Language not enabled on the agent in the target environment
Figures stored in the wrong columns	Value assignments remapped in the wrong order
